Active Tray Drive with Proximity Switches

The Active Tray drive system is a radical departure from conventional tray mounted drive systems. First, it utilizes the Center Drive mast and socket mounting system making it both stable and portable. It is the first untethered tray drive that has no plugs or wires to disconnect to remove it. The surface is infinitely adjustable in height, pitch and proximity to the user and never touches the armrests. The installation of the switches, instead of requiring tedious mounting, are sandwiched between two layers of polycarbonate. The polycarbonate pieces are attached with a flat hinge and a single knob for fast, easy access to proximity switches. This ground-breaking approach to tray driving also positions the display at midline for easy viewing and virtually eliminates exposed wiring.

The Active Tray Drive will reduce repair calls due to wiring damage and accidental disconnections and allow fast and easy field adjustments to switch positions. It can be operated with 4 or 5 naked proximity switches.

Available Pre-Assembled • Interfaces with Most Expandable Electronics

Up to 3 Socket Positions • Gold Plated Connection Pins
